

URBAN PLANNING

Bolzano, Italy

Judges comments:

The authors of the project consider the principal scope of the competition to be the creation of a multimodal centre for Bolzano. This entails an effort for the research for a contemporary architecture which will fit into the context of a long term town planning approach. Of equal importance for the planners are the dialog and the relationship between the buildings and the interconnected public spaces and green areas. Innovative, modern, sustainable and ecological solutions are aimed at integrating the Piani district within the town planning context of the city and at eliminating the barrier effect represented by the existing railway line.
