PROJECT PHASE: Under construction

A metal and glass pieces graft - three tapered foyer at different levels - with spectacular 180 ° view over the City Life heart upset and concludes the old building facade, so far remained incomplete. A large squared volume broke out from the existing coverage, while an unexpected asteroid - auditorium float beside on a crown of existing columns. A real volume earthquake that required and generated the solution: the invention of a silver air comet that overcomes and embrace

the new building facade, together with part of the building sides and roof. Turns it into a new creature, unusual yet still consistent with the entire complex.

It will be a unique landmark, designed like a swarm of luminous rays that come off, waving from the densest head core to form a tail 200 m long; because its horizontal extent competes with the height of skyscrapers.
