

MUGELLO GRANDSTAND

Project

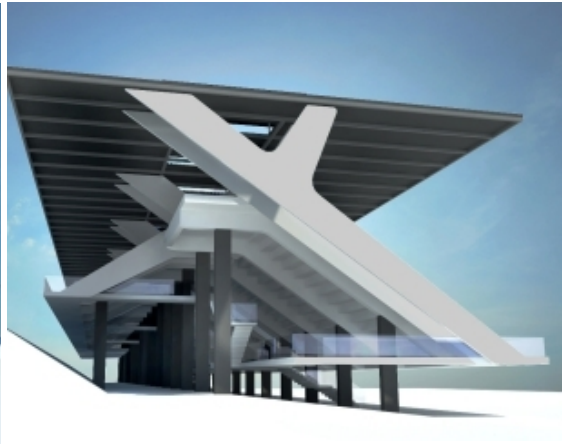

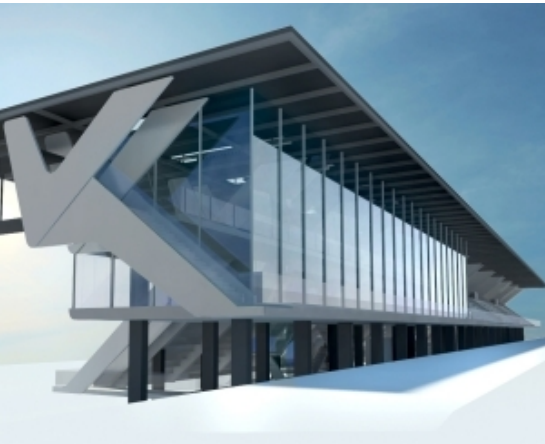

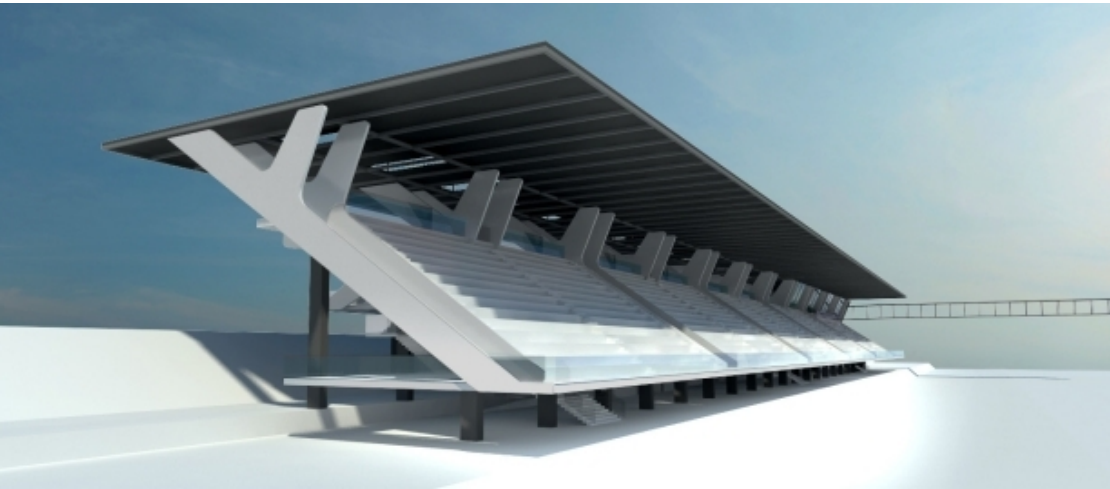

Mugello, Italy

The new main grandstand of Mugello's car racing circuit presents itself as a sculptural element side by side to the existing assistance ofces and box. From a composition stand point, the structure is defined by a group of reinforced concrete prefabricated elements supported by a frame with a branched geometry to support the fat cantilever roof. Functionally speaking, the structure is crossed by tracks laid down on the ground and it contains two paired grandstands with the larger one facing the straight course and the other facing the two main bands, conducive to dual visibility to the viewers.

This all is completed by a protected area with glazed windows and put to use as hospitality and restaurant, bridged over to the existing structure by a light gangway.

SPORT

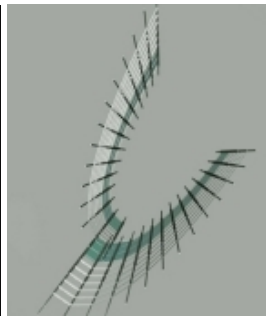

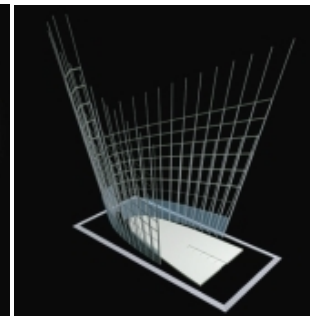

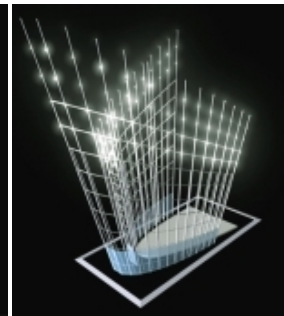

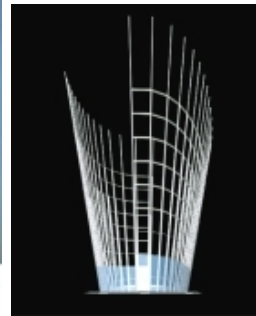

SCULPTURE OF LIGHT

Competition

Milan, Italy

International Competition For III Millenium. This luminous sculpture is formally related to nearby Pirelli skyscraper's. This project is characterized by two light wings done using metal tubes drawn on the sky scraper's shape. Projecting screens in translucent glass and spot lights create, at night, a "luminous sculpture" effect.

in collaboration with: H. Grabowski
